Experiment -1

AIM: Create an IAM user with programmatic access only, download the access key and secret key, and document the steps with screenshots.Then set up a billing alert for the account so that an email is received when the Free Tier limit is about to be crossed.

Description: IAM (Identity and Access Management) is an AWS service used to securely manage access to AWS resources and services. Using IAM, an AWS account administrator can create and manage users, groups, roles, and permissions.

In this task, an IAM user is created with programmatic access only, which means the user accesses AWS services through programmatic credentials rather than signing in to the AWS Management Console. The AWS credentials include an Access Key ID and a Secret Access Key. These credentials can be used with tools such as the AWS CLI, SDKs, or applications.

IAM follows the principle of least privilege, meaning users should receive only the permissions necessary to perform their required tasks. This improves the security of the AWS account.

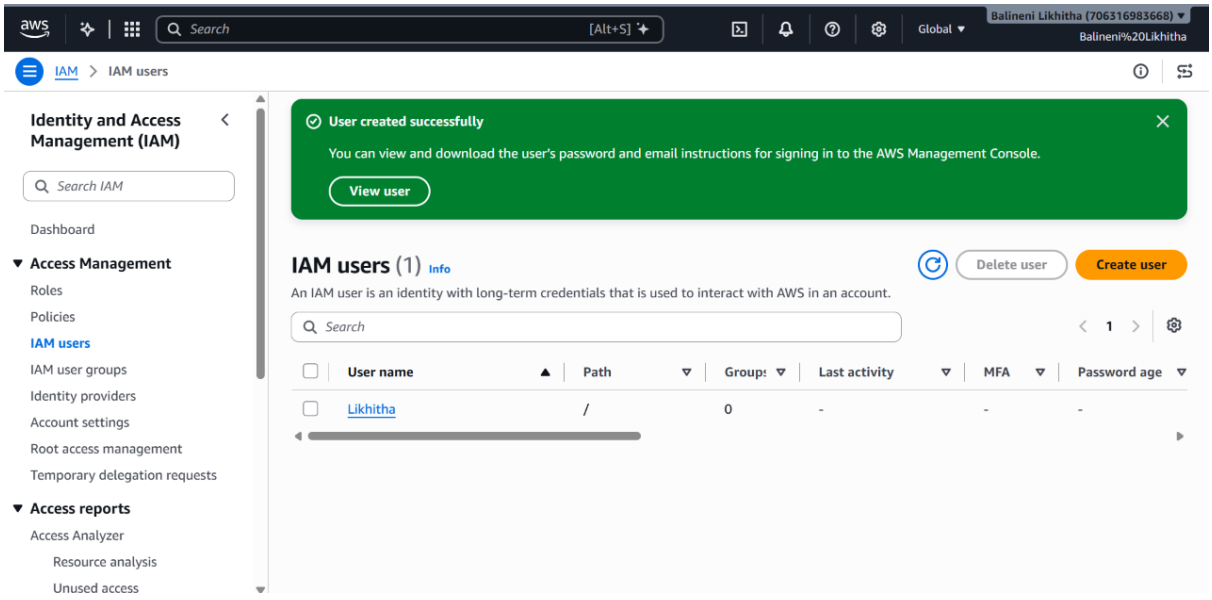

Steps:

Step 1: Open IAM Service

First, log in to the AWS Management Console. In the AWS search bar, search for IAM (Identity and Access Management) and open the IAM dashboard.

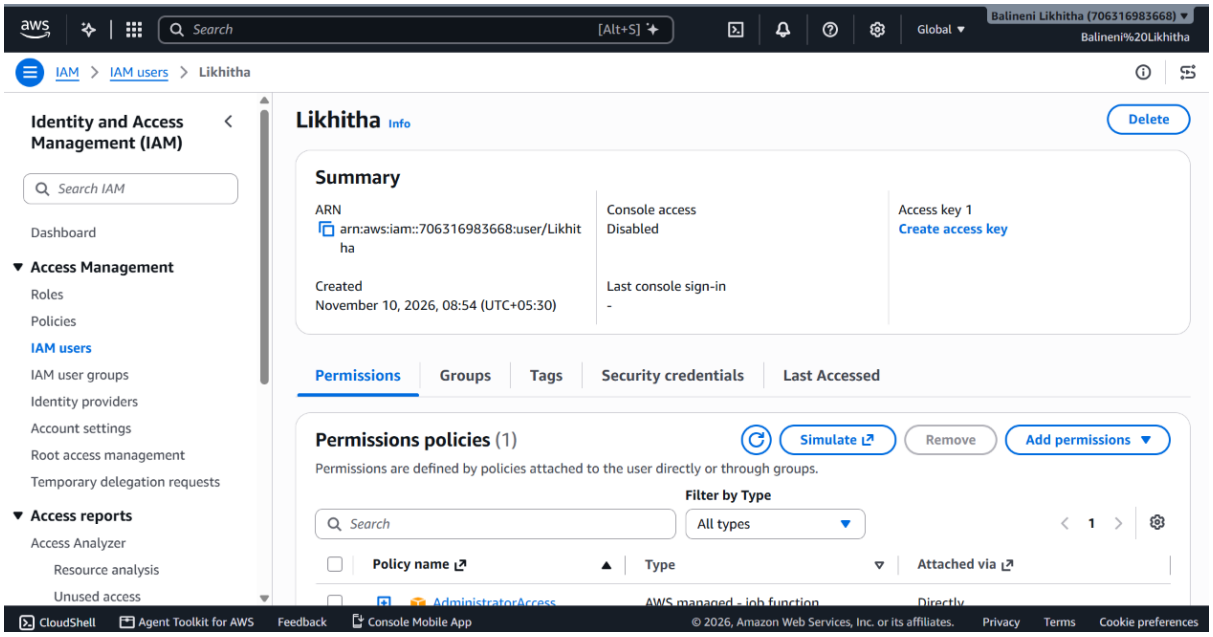

Step 2: Create an IAM User

In the IAM dashboard, click on **Users** and create a new IAM user. Enter the required username for the user account.

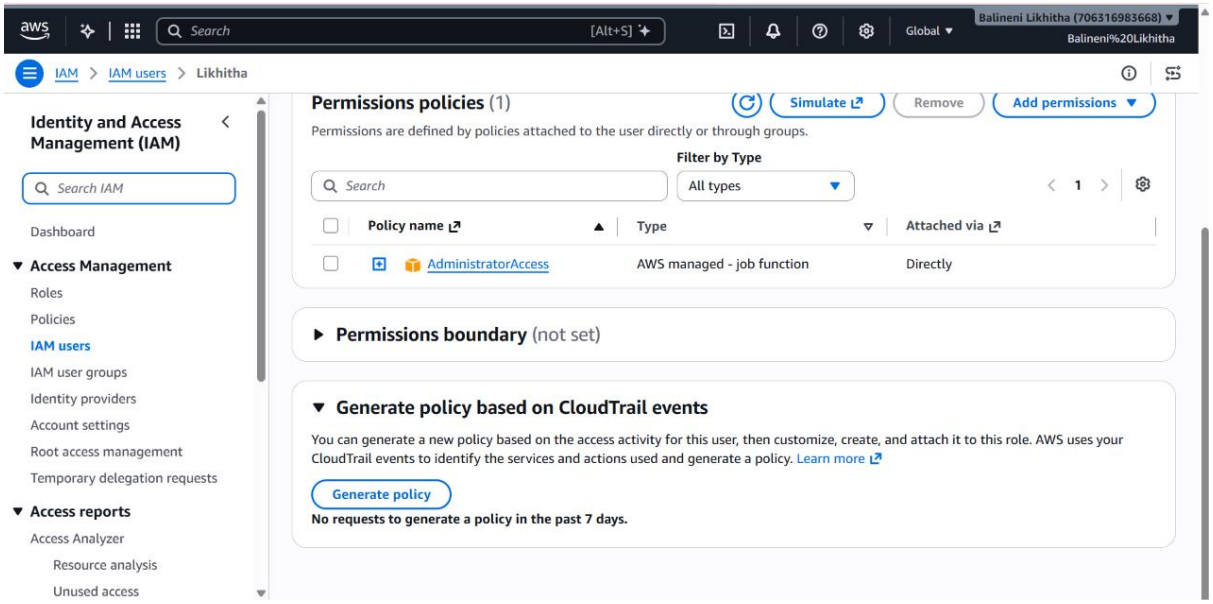

Step 3: View the Created IAM User

After creating the user, open the IAM user details page. The user information, permissions, groups, and security credentials can be viewed from this page.

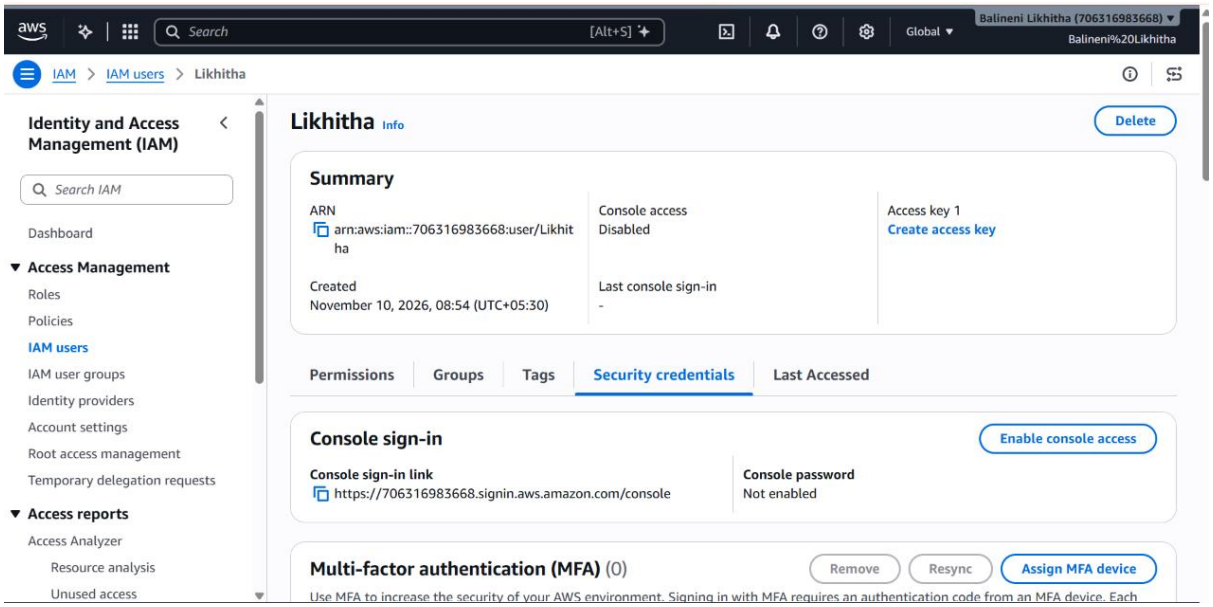

Step 4: Configure User Permissions

Open the **Permissions policies** section of the IAM user. Add the required permissions or policies based on the access needed by the user.

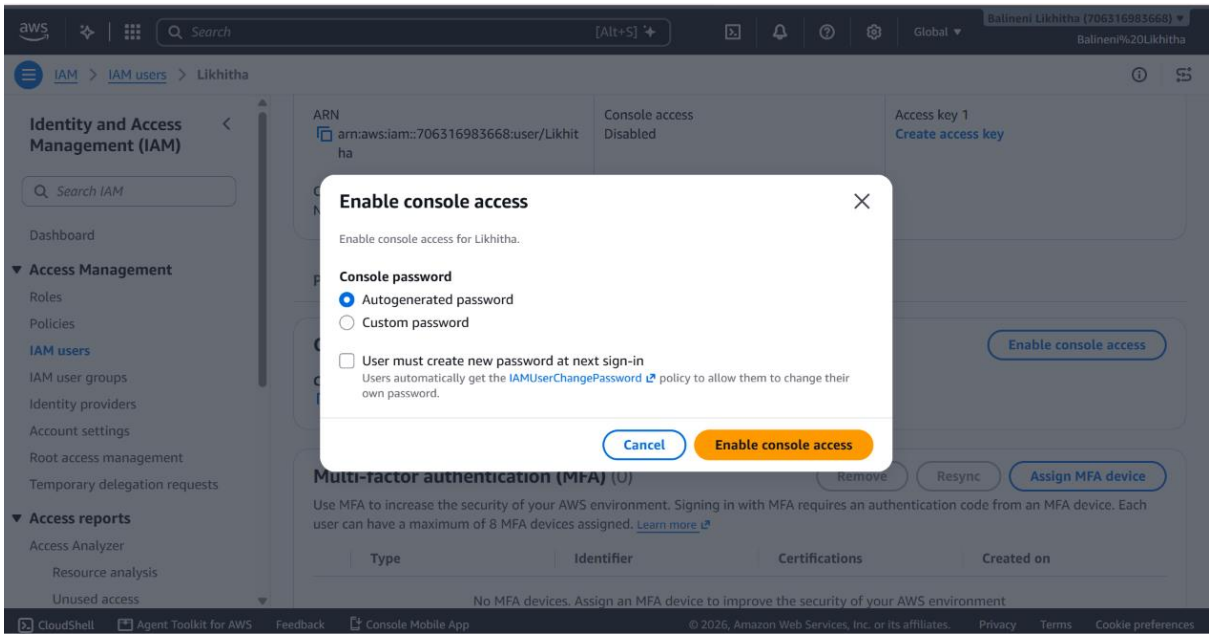

Step 5: Open Security Credentials

Go to the **Security credentials** tab of the IAM user. This section is used to manage access keys, console access, and multi-factor authentication.

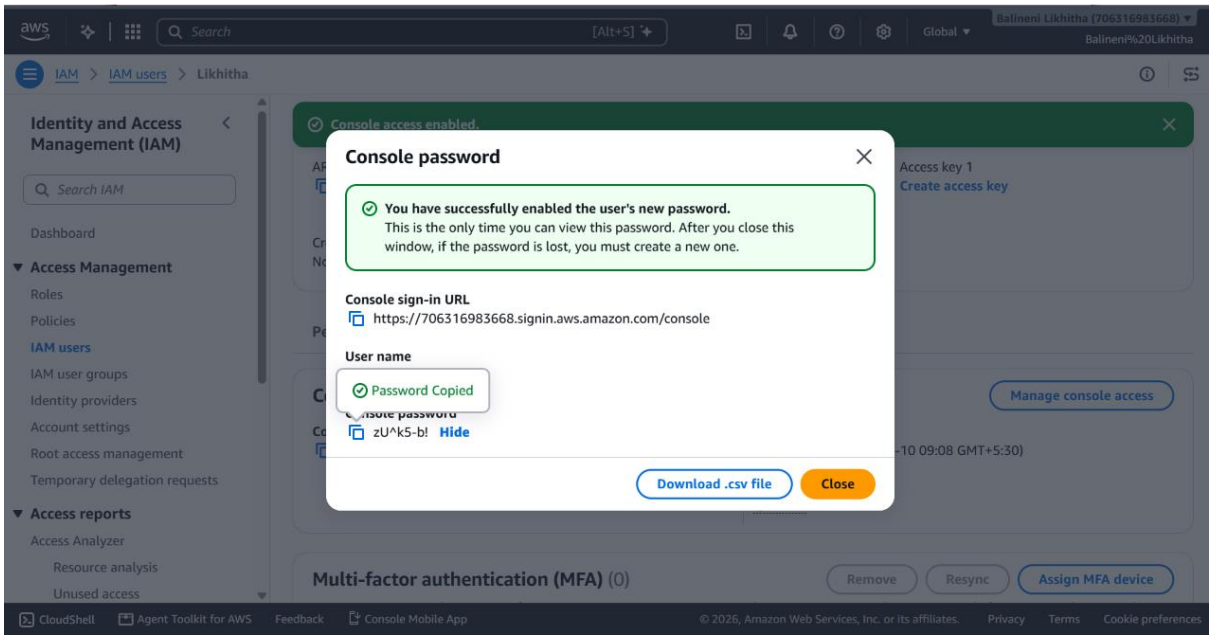

Step 6: Configure Access Credentials

From the Security credentials section, configure the required access method for the IAM user.

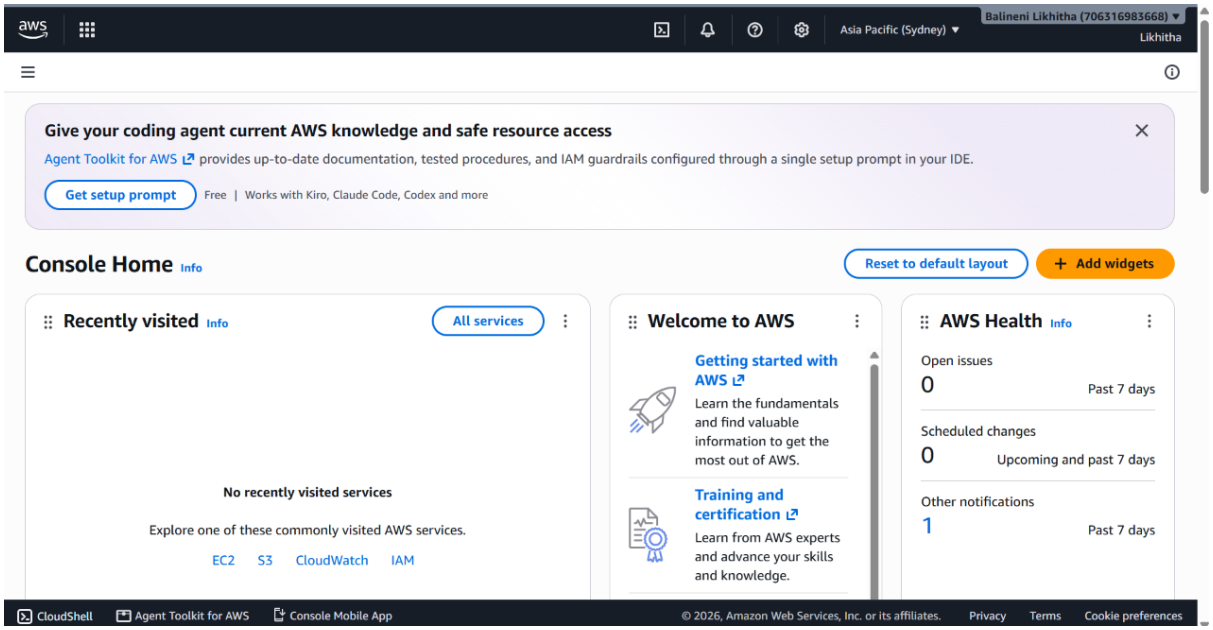

Step 7: Set the Console Password

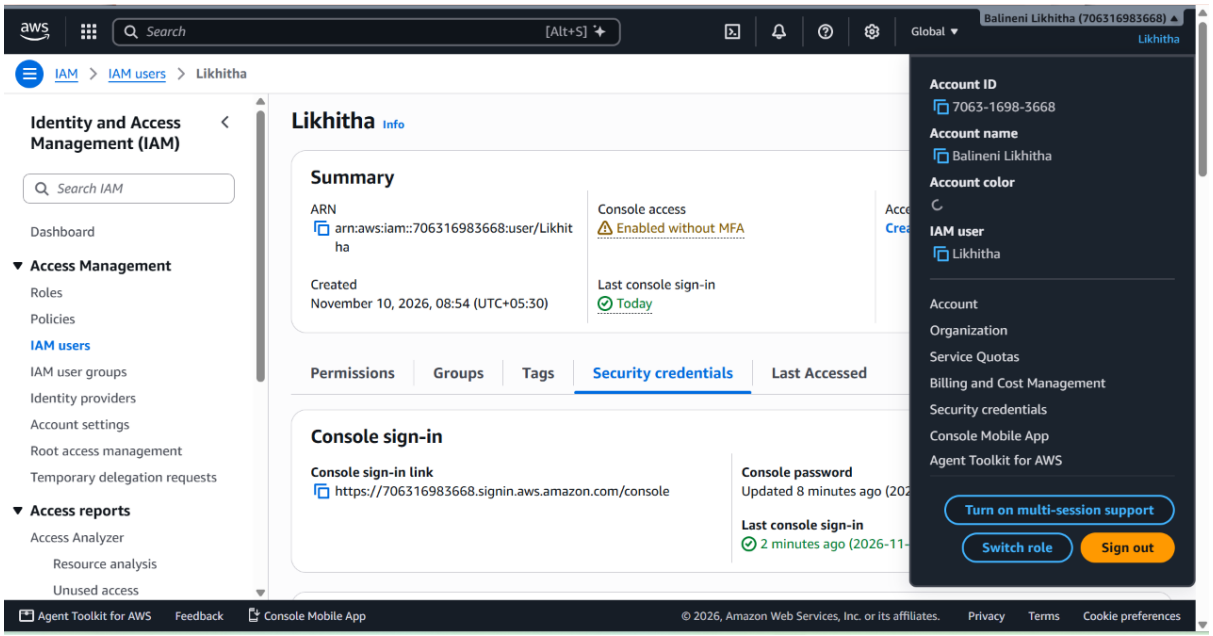

If console access is enabled, AWS displays the console password configuration window. Create a secure password according to the required security settings.

Step 8: Verify IAM User Access

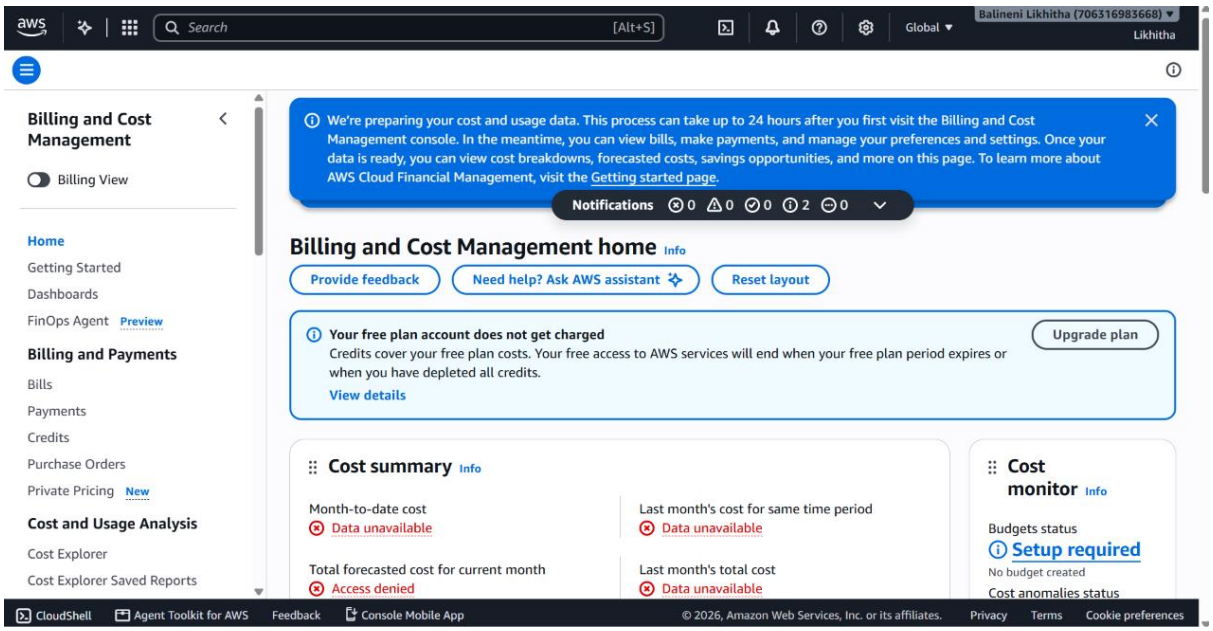

After configuring the credentials, verify that the IAM user has been successfully created and the required access settings have been applied.

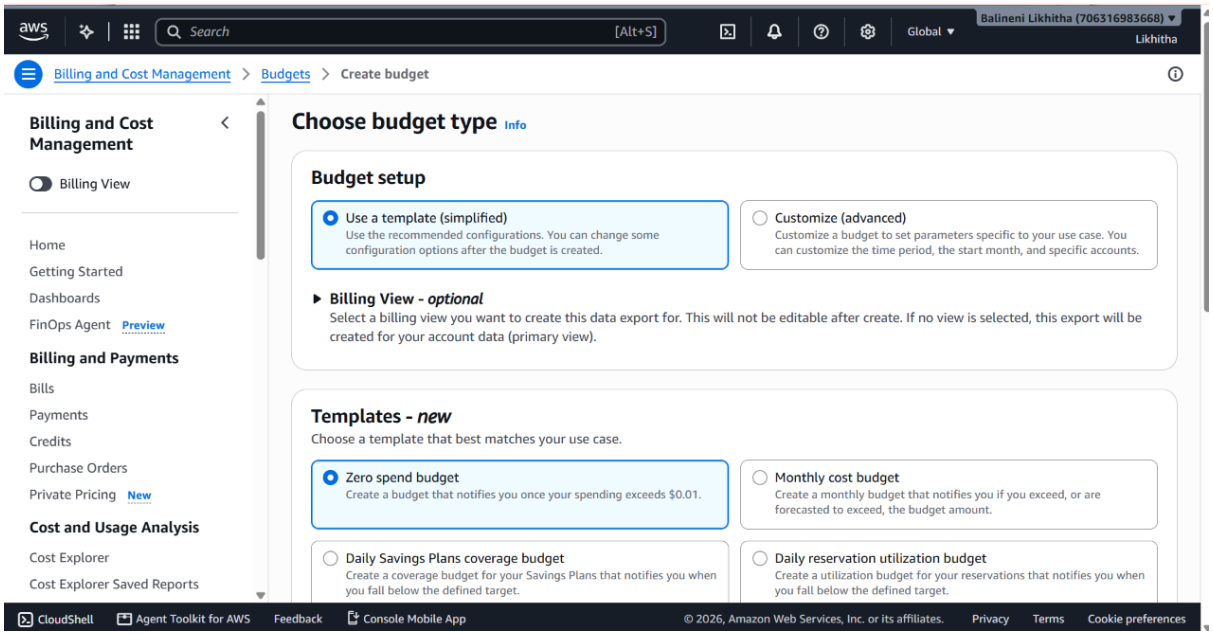

Step 9: Open Billing and Cost Management

From the AWS Management Console, open **Billing and Cost Management**. This service is used to monitor AWS costs, usage, budgets, and Free Tier usage.

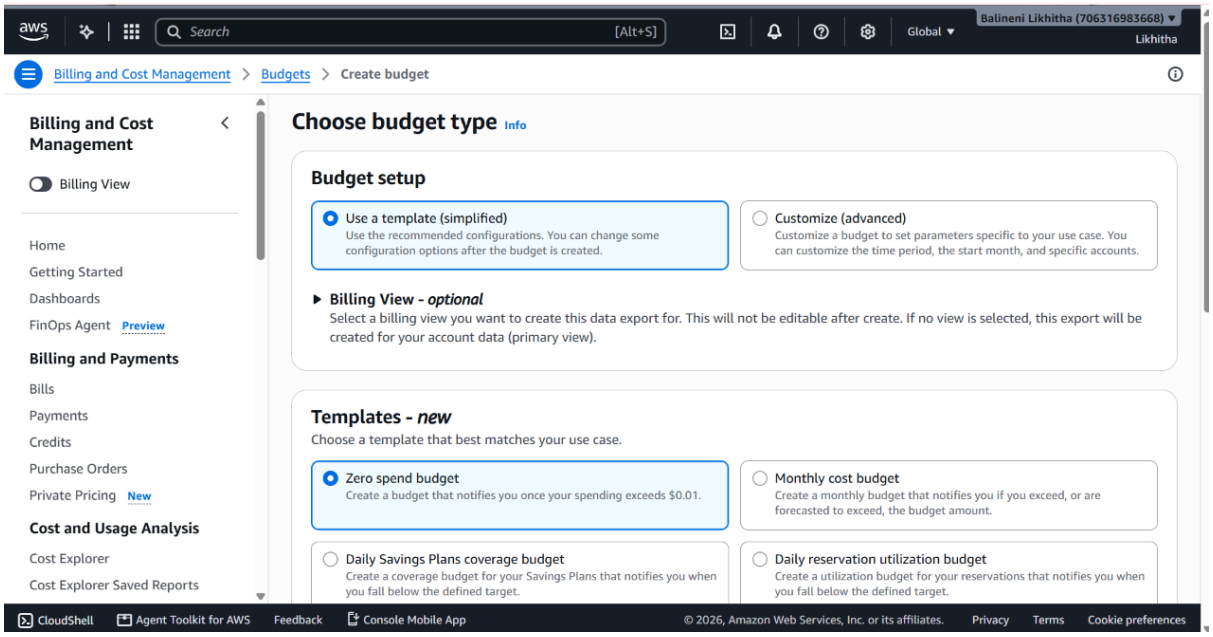

Step 10: Create a Budget

In the Billing and Cost Management section, select **Budgets** and click **Create budget**.

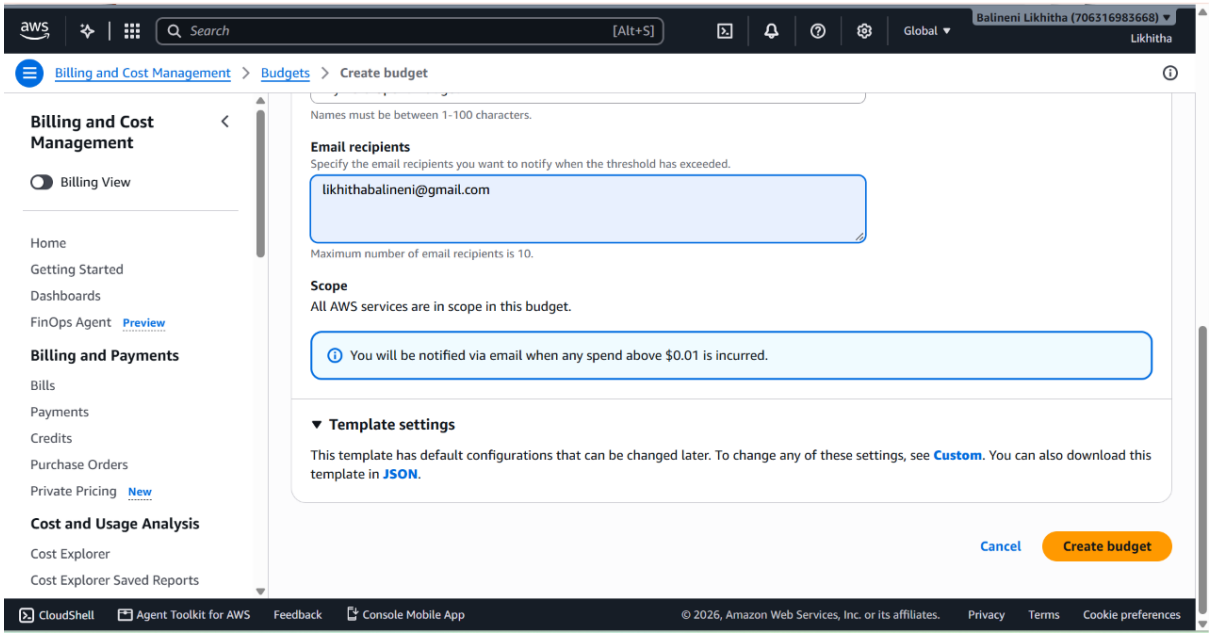

Step 11: Select the Budget Type

Choose **Use a template (simplified)** or select the appropriate budget type. For monitoring AWS costs, choose a suitable monthly cost budget or Free Tier usage monitoring option.

Step 12: Configure the Billing Alert

Enter the required budget details, including the **budget name**, **budget amount**, and the **email address** where notifications should be sent.

Output: Create and Verify the Budget

After entering all the required details, click **Create budget**. The newly created budget will appear in the AWS Budgets dashboard.
